University of Southern California

New York Times Article: “What you Really Need to Know”

“In an earlier era, when many people were involved in surveying land, it made sense to require that almost every student entering a top college know something of trigonometry.

Today, a basic grounding in probability, statistics, and decision analysis makes far more sense.”

Larry Summers

Using Decision Trees in Space Decisions

Asteroid Strategy

The President announced in April 2010 a human mission to an asteroid. The budget leverages NASA's human and robotic activities for the mission and also accelerates efforts to address potentially hazardous asteroids:

- To protect our planet
- To advance exploration capabilities and technologies for human space flight
- To learn how to best utilize space resources.

The FY14 budget aligns relevant portions of NASA's science, space technology, and human exploration capabilities to plan for the mission.

NASA will build on a rich history of engaging citizen scientists, researchers and individual innovators in this quest.

Mission Concept

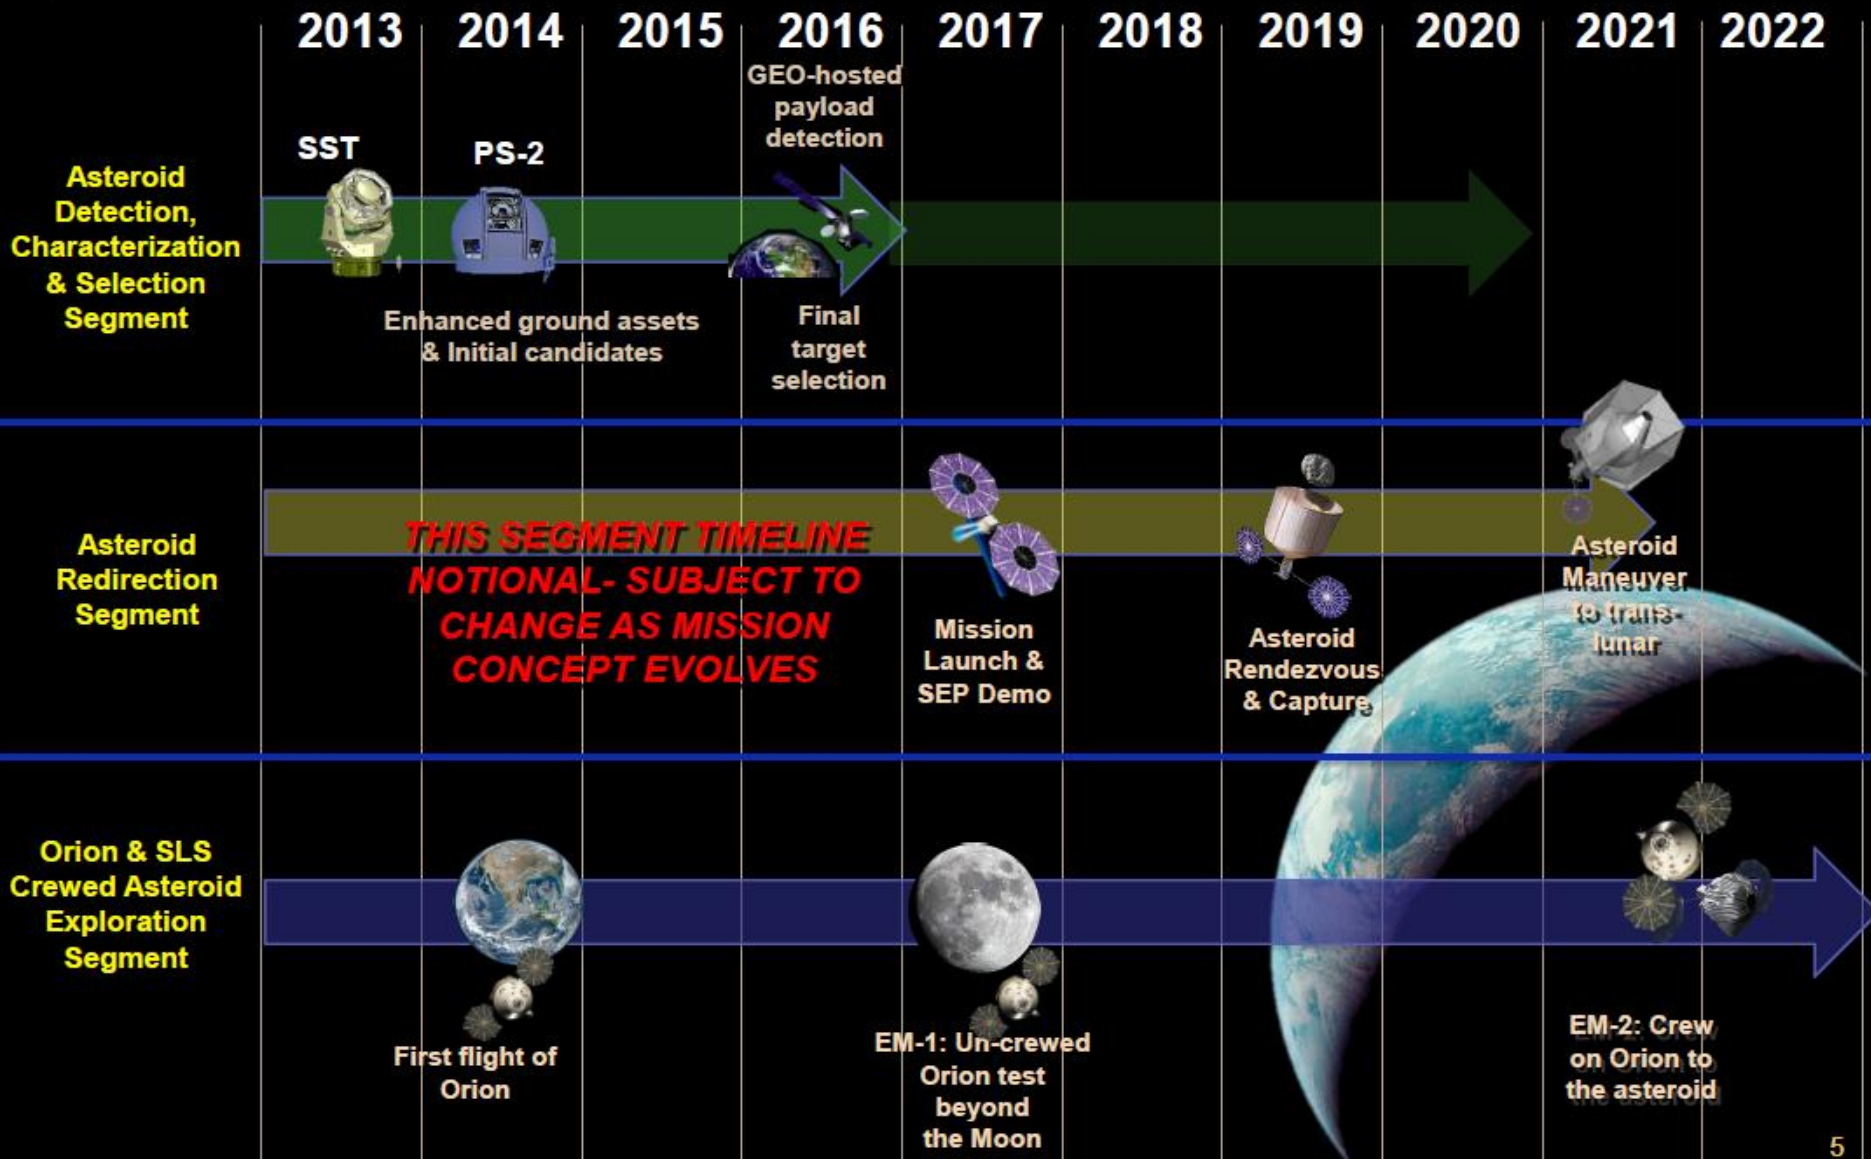

- Capture and redirect a 7-10 meter diameter, ~500 ton near-Earth asteroid (NEA) to a stable orbit in trans-lunar space
- Enable astronaut missions to the asteroid as early as 2021
- Parallel and forward-leaning development approach

Time Constraints

Alignment Strategy

NASA's Mission Objectives? Stakeholders?

Who are the stakeholders?

Advance Science
Public Perception
Work toward long term objectives

Safety of crew
Safety of planet

Public Perception
Money

Ability to deflect
Asteroid for
planetary
protection

Possible private
investors !

Uncertainty?

Generic Decision Tree for 1 Alternative

February 2nd 2014

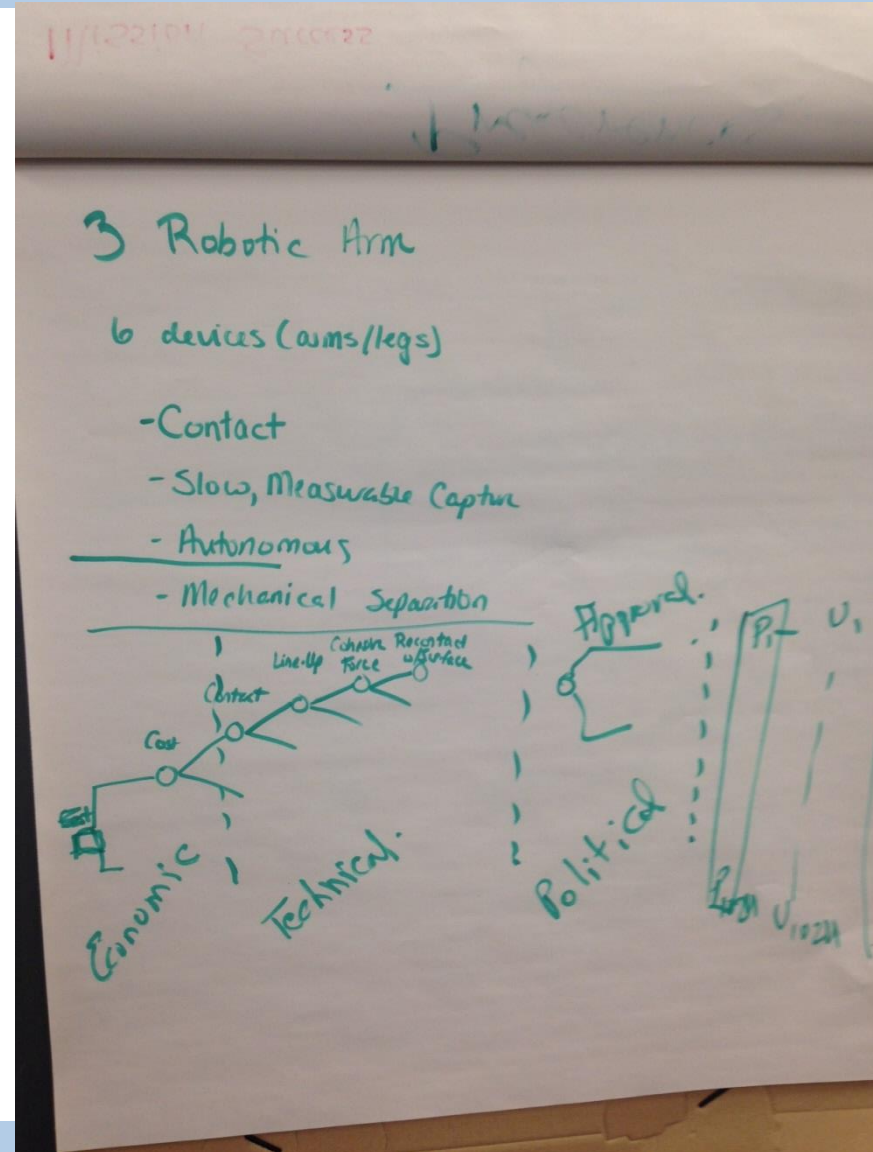

Probability of Capture

With sensitivity analysis, we showed that improving probability of capture will add significant value to the space mission.

It will help with

- * Positive Public Perception/Awareness
- * Advance Science (Return with rich Asteroid)
- * Funding Approval (Money)
- * Safety of Crew
- * Allow more time for observing/ C/C
- * Allow more time for deflection

Worth more than \$50 million radar.

NASA Wants \$6 Million Worth of Ideas for Grabbing Asteroid

BY ALAN BOYLE

March 21st
2014

NASA is putting out a formal call for projects that will help robots and astronauts grab an asteroid from deep space and bring it closer to Earth for study.

The Broad Agency Announcement, released Friday, envisions spending up to \$6 million on as many as 25 proposals this year. The proposals should focus on technologies that can be used to identify potential targets, send robotic spacecraft to capture the selected asteroid and put it in a stable orbit beyond the moon, or help astronauts get to the space rock and bring back samples in the mid-2020s.

"We're reaching out to seek new and innovative ideas as we extend the frontier of space exploration," Bill Gerstenmaier, NASA's associate administrator for human exploration and operations, said in a news release. "To reach Mars, we'll rely on new technologies and advanced capabilities proven through the Asteroid Initiative. We're looking forward to exciting ideas from outside NASA as well to help realize that vision."

Capitalizing on ideas

The space agency is planning an Asteroid Initiative Opportunities Forum at NASA Headquarters in Washington on Wednesday to provide more information for potential participants. Next week's forum will be live-streamed online to folks who sign up.

Decisions with Multiple Objectives

37 Years Later

Control of Unmanned Aerial Systems
(UAS) using Multiattribute Utility Theory

Real-Time UAS Decision Making

Control Dynamics for Agents

$$\dot{x}_i = g_i(x_i)u_i + h_i(x_i), x_i(0) = x_{i0}, \forall t \in [0, \infty), \forall i \in \mathbf{N}.$$

Multiple Attributes

- Surveillance
- Collision avoidance
- Tracking

How do we derive real-time decision making algorithms for unmanned aerial systems (UAS) to meet these objectives?

Control-theoretic algorithms require an appropriate Lyapunov function with certain properties. ***Can be hard to find and hard to solve, even when found.***

Valicka, C., D. Stipanovic, and A.E. Abbas, "Multiattribute Utility Functions for Multiobjective Control," Proceedings of the 2013 American Control Conference, Washington, District of Columbia, June 17-19, 2013.

Valika C, Stipanovic D, and A.E.Abbas, 2015 "Control Strategies for Players in Pursuit-Evasion Games Based On Their Preferences," International Game Theory Review"(Forthcoming)

Real-Time UAS Decision Making

Multiple Attributes

- Surveillance
- Collision avoidance
- Tracking

Inspired by the additive and multiplicative forms

$$C(v_1, \dots, v_n) = a\psi^{-1}\left[\prod_{i=1}^n \psi(l_i + (1-l_i)v_i)\right] + b$$

Most general form of a multiattribute utility function satisfying additive ordinal preferences
Has a meaningful interpretation for its assessment

Real-Time UAS Decision Making

Control Dynamics for Agents

$$\dot{x}_i = g_i(x_i)u_i + h_i(x_i), x_i(0) = x_{i0}, \forall t \in [0, \infty), \forall i \in \mathbf{N}.$$

Multiple Attributes

- Surveillance
- Collision avoidance
- Tracking

$$C(v_1, \dots, v_n) = a\psi^{-1}\left[\prod_{i=1}^n \psi(l_i + (1-l_i)v_i)\right] + b$$

$$\max(v_1, \dots, v_m) \leq -\ln\left(\frac{C(e^{-v_1}, \dots, e^{-v_m}) - 1}{a(1-l_{Max})} + 1\right)$$

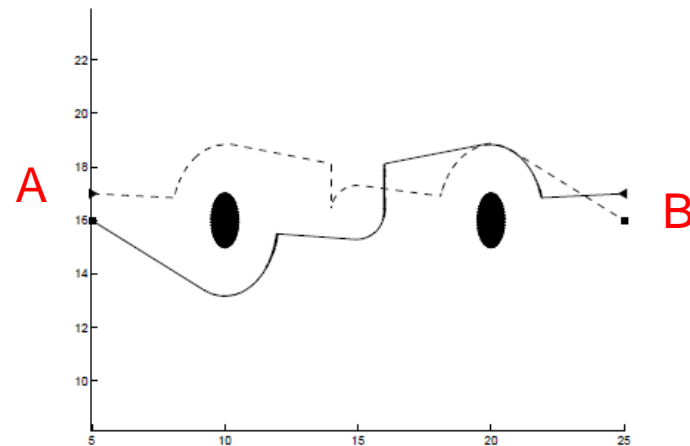

Multiattribute Utility functions with mutual preferential independence can be used in Lyapunov-like functions for control of agents pursuing multiple objectives.

The multiattribute utility function can be assessed in a meaningful way instead of having to search for the Lyapunov function.

Closed form expression for the control laws makes the problem feasible for real-time decisions.

Tracking and Collision Avoidance

$$\dot{x}_i = g_i(x_i)u_i + h_i(x_i), x_i(0) = x_{i0}, \forall t \in [0, \infty), \forall i \in \mathbf{N}.$$

Tracking

$$v_{ij}^p(x_i^p, x_j^p) = \max\{0, \|x_i^p - x_j^p\|^2 - \hat{R}_{ij}^2\}^2.$$

Collision Avoidance

Surveillance

By this we mean that the vehicles' sensors have footprints whose union is much smaller than the area to be covered. Thus they have to move around to survey the most amount of space in the given domain.

There is still work that needs to be done

Decision analysts need to continue to work more closely with other fields!

Decisions in Medicine

Decisions in Systems Engineering

DECISION ENGINEERING: FROM ENGINEERING PHENOMENA TO VALUE

National Science Foundation Workshop
October 29th/30th

- Systems Engineering Community
 - Have many misconceptions about decision analysis
 - Would embrace the opportunity to learn and work with decision analysts.
- Better understanding of value functions and structural models is needed.

*Approximate vs. Fundamentally Flawed
Decision Making Method*

Example 1

Automobile Design with Customer Feedback (Based on a True Story)

Project Design Using Customer Feedback

An automobile company was interested in designing its new automobile in the early 2000s.

It **considered three design elements**

- Number of cylinders (4/6)
- Size (small/medium)
- Transmission type (manual/auto)

The company conducted a survey

They received feedback from three major categories of customers.

Customer Feedback:

Group A : Family Sedan Folk

Size: Strongly prefers medium size car to small.
They will not buy a small car.

Transmission: Prefers automatic transmission to manual
(but might buy the manual).

Engine: Prefers 6 cylinders to 4
(but might buy 4).

Customer Feedback:

Group B: Sports Folk

Size: Prefers small size to medium.
(but might buy a medium car)

Transmission: Strongly prefers
manual to automatic transmission.
(they will not buy automatic).

Engine: They prefer 6 cylinders to 4
(but might buy 4).

Customer Feedback:

Group C : Big City Folk

Size: Prefers small size to medium.
(but might buy a medium car)

Transmission: Prefer
automatic transmission to manual.
(but might buy manual).

Engine: Strongly prefer 4 cylinders to 6
(they will not buy 6).

Summary of Customer Feedback

	Small Car	Medium Car	Auto	Manual	6 Cylinders	4 Cylinders
Results	Group A will not buy it, Groups B,C prefer it		Group B will not buy it, Groups A, C prefer it		Group C will not buy it, Groups A, B prefer it	

Summary of Customer Feedback

	Small Car	Medium Car	Auto	Manual	6 Cylinders	4 Cylinders
Results	Group A will not buy it, Groups B,C prefer it		Group B will not buy it, Groups A, C prefer it		Group C will not buy it, Groups A, B prefer it	

Final design:

A small car.

Automatic transmission.

6 cylinder engine.

Project Design Using Customer Feedback

Final design

A small car.

Automatic transmission.

6 cylinder engine.

Group A will not buy it because of its size.

Group B will not buy it because of its transmission.

Group C will not buy it because of the cylinders in the engine.

The company designed a car that nobody would buy!!!

And the list of methods goes on...

Quality Functional Deployment

Six Sigma

Design by requirements

..

There is still work that needs to be done

Decision analysts need to reach out to senior leadership in enterprises and the government to gain further support

Obama Signs Executive Order

- *“Behavioral science insights—research insights about how people make decisions—not only identify aspects of programs that can act as barriers to engagement, but also provide policymakers with insight into how those barriers can be removed through commonsense steps, such as simplifying communications and making choices more clear.”*
- *“When these insights are used to improve government, the returns can be significant.”*

MEMORANDUM FOR DHS LEADERSHIP

FROM: Secretary Johnson

A handwritten signature in black ink, appearing to read "John Johnson", written over the printed name "Secretary Johnson".

SUBJECT: Strengthening Departmental Unity of Effort

The Department of Homeland Security has many strengths, starting with the professionalism, skill, and dedication of its people and the rich history and tradition of its Components. These strengths have allowed the Department to achieve many successes in the short time since its creation. It is clear to me, however, that DHS has yet to reach its full potential as an organization. Such potential is difficult to achieve and takes even the best organizations many years. Complicating matters is the difficult budget environment we currently face.

Resource constraints also provide the impetus to build and mature our organization into one that is greater than the sum of its parts—one that operates with much greater unity of effort. As I noted in my recent testimony on our FY 2015 budget request, I am committed to improving our planning, programming, budgeting, and execution processes through strengthened Departmental structures and increased capability. We must have better traceability between strategic objectives, budgeting, acquisition decisions, operational planning, and mission execution, in order to improve both Departmental cohesiveness and operational effectiveness.

To be clear, these changes are not designed to centralize decision-making authority and processes within an opaque DHS Headquarters. To the contrary, these changes are intended to transparently incorporate DHS Components into unified decision-making processes and the analytic efforts that inform decision-making. Our collective goal is to better understand the broad and complex DHS mission space and empower DHS Components to effectively execute their operations.

Large Enterprises Adopting a Unity of Effort Approach

- What does unity of effort mean for decision making?

A Decision Analysis View of Unity of Effort:

“Unity of Effort” does not mean that all components should do the same things. The nature of their work is different. It means, that when faced with the same decision alternatives, the different components should make the same decisions”.

Be clear about trade-offs

Use a coherent decision-making method

[Elon Musk](#) and [Stephen Hawking](#), along with hundreds of artificial intelligence researchers and experts, are calling for a worldwide ban on so-called autonomous weapons, warning that they could set off a revolution in weaponry comparable to gunpowder and nuclear arms.

[In a letter](#) unveiled as researchers gathered at the International Joint Conference on Artificial Intelligence in Buenos Aires on Monday, the signatories argued that the deployment of robots capable of killing while untethered to human operators is “feasible within years, not decades.” If development is not cut off, it is only a matter

of time before the weapons end up in the hands of terrorists and warlords, they said.

Unlike drones, which require a person to remotely pilot the craft and make targeting

Navy robotics engineers are working to develop autonomous tools that can integrate with other technologies. But in field tests, the autonomous future still seems far away. By Zackary Canepari, Drea Cooper and Emma Cott on May 6, 2015.
